Google Ads That Actually Work

Tracking audit

Client: **Gimme Care** Date: **2026-06-09** Vertical: **Ecommerce — GLP-1**

84%

Advanced — solid foundation with identified gaps

Executive read

84% Advanced means the core conversion signal is real and Smart Bidding can operate on it. The setup is more sophisticated than average — a server-side GTM container on `abc.gimme.care` handles the primary Google Ads firing, and two separate conversion actions cleanly separate new customers (primary, bidding signal) from all purchases (secondary, revenue reporting). That architecture is correct.

Three things need attention. The most important: **both browser and server containers are actively firing Google Ads conversion tags with identical conversion labels** — `gads__purchase` in the browser fires the same label (`Z80BCMPQo6wbEJGPq9BB`) as `gads - purchase` on the server, and same pattern for the first-time purchase tag. Google Ads deduplicates using the `order_id / oid=` parameter. If transaction IDs are

being passed in both layers, deduplication is handling it and you are fine. If not, every purchase is counting twice — once from the browser hit, once from the server hit. This is the single highest-priority item to verify. Check via GTM Preview mode or the Google Ads Tag Diagnostics page for duplicate conversion requests on the same order ID. Second: **cart data is disabled** (`enableProductReporting: false`) on both server-side purchase tags. Gimme runs Shopping and has a Merchant Center account — turning on cart data enables product-level ROAS reporting and is a straightforward GTM change. Third: **the cookie consent – gimme care tag is paused** in the browser container. If Consent Mode is not active, Google cannot model conversions from users who deny cookies — this is recoverable lost signal. Unpause and verify via Chrome DevTools.

What is NOT a problem: "Purchase (GTM)" is not a legacy or redundant pixel — it intentionally tracks all purchases (new + existing customers) as a secondary reporting action, while the primary "First Time Purchase (GTM) - SST" tracks new customers only. That is a clean and deliberate setup. The `url_parameters__capture_and_store` and `url_parameters__decorate_links` tags being paused is expected — they were replaced by `utm_carry`. OCT diagnostics (D36-D41) are skipped by design — ecommerce tracks onsite, not CRM imports.

A fresh LP audit (2026-05-27, 13 days, 85% Good) at `context/analysis/lp-audit.md` flagged the intake consent banner on step 1 as inconsistent across entry paths (INT-01). This is directly connected to the paused consent tag finding above — if Consent Mode is not firing correctly, the LP audit's CVR data for the intake funnel is partly a tracking artefact, not purely page quality. Fix Consent Mode before drawing conclusions from intake CVR numbers. Re-run only if you want fresher data.

Module scores

COMPLETENESS

Good — 3/4

CONSENT + DEVTOOLS

—

Pending

Critical issues

No critical issues found. All FAIL diagnostics are in pending DevTools modules.

D46 — Advanced

Cart data disabled on server-side purchase tags

Product-level ROAS not available in Shopping. Affects feed-level bidding optimisation.

Fix: In GTM server container, open gads – purchase and gads – first time purchase. Set enableProductReporting: true and pass an items array from the dataLayer.

D25 — Consent

Cookie consent tag is PAUSED — Consent Mode v2 likely inactive

Google cannot model conversions from users who decline cookies. Recoverable lost signal. Also connected to LP audit INT-01 finding.

Fix: Unpause cookie consent – gimme care in browser container, publish, then verify gcs= appears in Google Ads network requests via Chrome DevTools.

Completeness (D01–D07)

87.5% — Good

ID	DIAGNOSTIC	TIER	STATUS	POINTS	DETAILS
D01	Coverage	API	PASS	15/15	"First Time Purchase (GTM) - SST" — PURCHASE, ENABLED, 38,307 lifetime conversions
D02	Primary / secondary	API	PASS	15/15	One PURCHASE primary (new customers); all purchases + funnel events correctly secondary
D03	Duplicate detection	API	PASS	10/10	"Purchase (GTM)" = all purchases; "First Time Purchase (GTM) - SST" = new customers only — intentionally different events, not duplicates
D04	Naming consistency	API	WARN	3/5	"checkout - first time" breaks the "(Source)" suffix convention used by all other actions; lowercase, no source tag
D05	Goal category	API	PASS	10/10	All categories semantically correct: PURCHASE, SIGNUP, ADD_TO_CART, BEGIN_CHECKOUT
D06	Counting method	API	WARN	8/15	Primary correctly MANY_PER_CLICK. "Purchase (GTM)" and "Purchase (Posthog)" both ONE_PER_CLICK — wrong for ecommerce purchase events even as secondary reporting actions
D07	Account defaults	API	PASS	10/10	Single PURCHASE primary account-wide; all 17 campaigns use account-default goals (CUSTOMER level); no campaign overrides

Tag health (D08–D17)

100% — Excellent (API tier)

ID	DIAGNOSTIC	TIER	STATUS	POINTS	DETAILS
D08	Action status	API	PASS	15/15	All 7 conversion actions ENABLED including primary
D09	Volume zero-check	API	PASS	15/15	1,045 primary convs last 7 days (Jun 2–8); no zero-conversion days
D10	Volume anomaly	API	PASS	10/10	Prior 7d: 1,178 convs; Last 7d: 1,045 — 11.3% decline, well under 30% threshold. Jun 6–8 dip consistent with 8-day conversion lag
D11	Google Tag presence	DevTools	PENDING	—	Run <code>/tracking-audit tag-health --url=https://gimme.care/lp/semaglutide</code>
D12	Conversion Linker	DevTools	PENDING	—	Conversion linker tag is ACTIVE in both containers — verify cookies set on landing page
D13	Tag firing	DevTools	PENDING	—	Priority: verify browser + server are deduplicating via <code>order_id</code> (see Priority 1 in Recommendations)
D14	Transaction ID	DevTools	PENDING	—	Critical for SST deduplication verification
D15	Dynamic value	DevTools	PENDING	—	<code>{{value}}</code> variable used — verify it resolves dynamically at purchase
D16	Currency	DevTools	PENDING	—	<code>{{currency}}</code> variable used — verify resolves to "USD"
D17	Backend cross-check	Manual	SKIP	—	Compare Posthog/backend 30-day order count to Google Ads 38,307 primary convs

Consent (D25–D29)

Partially Pending

ID	DIAGNOSTIC	TIER	STATUS	DETAILS
D25	CM v2 active	GTM + DevTools	WARN	cookie consent – gimme care tag is PAUSED in browser container. Consent Mode likely not active — unpause and verify gcs= in network requests
D26	Conversion modeling	API	PENDING	metrics.conversions field not in current pull — re-pull needed to compare observed vs modeled
D27	Modeling uplift	API	PENDING	Depends on D26
D28	CMP functionality	DevTools	PENDING	Run Chrome DevTools check on site URL to verify consent banner interaction
D29	Consent denial rate	Manual	SKIP	Requires CMP dashboard data

Attribution (D30–D35)

80% — Good

ID	DIAGNOSTIC	TIER	STATUS	POINTS	DETAILS
D30	Attribution model	API	PASS	5/5	All 7 actions use <code>GOOGLE_SEARCH_ATTRIBUTION_DATA_DRIVEN</code>
D31	Click-through window	API	WARN	5/10	Primary shows 30 days in API; business.md documents 90 days — discrepancy. 30 days covers 8-day lag (3.75×) so no bidding harm, but documentation needs correcting
D32	View-through window	API	PASS	5/5	1-day VTC on primary — correct; Search + Shopping only account
D33	Engaged-view window	API	SKIP	—	No Video/YouTube campaigns active
D34	Over-attribution ratio	Manual	SKIP	—	Backend data not provided; pull 30-day order count from Posthog/backend
D35	Conversion lag awareness	API	PASS	5/5	8-day lag explicitly documented in business.md and coded into <code>config/ads-context.config.json</code>

OCT (D36–D41)

Skipped — Ecommerce

Onsite purchases tracked via GACT pixel (SST). OCT not applicable. The Posthog `UPLOAD_CLICKS` actions are funnel analytics imports, not CRM-stage OCT. All D36–D41 skipped by design.

Hygiene (D42–D45)

90% — Excellent

ID	DIAGNOSTIC	TIER	STATUS	POINTS	DETAILS
D42	Conversion adjustments	API	SKIP	—	No adjustment actions configured. At ~\$4M/month consider setting up for subscription cancellations/refunds
D43	Data exclusions	API	SKIP	—	D10 PASS — no volume anomalies, check not triggered
D44	Deprecated actions	API	PASS	5/5	"Purchase (GTM)" is intentionally active (all purchases reporting action). No deprecated actions found
D45	GA4 import duplication	API	PASS	15/15	No GA4-import + GACT pairs both set to primary. No double-counting risk from GA4

Advanced (D46–D50)

75% — Good

ID	DIAGNOSTIC	TIER	STATUS	POINTS	DETAILS
D46	Cart data tracking	GTM	FAIL	0/5	enableProductReporting: false on both server-side purchase tags. Cart-level items/SKU/price NOT sent to Google Ads. Affects Shopping product-level ROAS
D47	New customer tracking	API	PASS	2/2	New customer tracking implemented via dedicated conversion action ("First Time Purchase (GTM) - SST") — not a parameter, a separate event. Clean approach
D48	Custom variables	Manual	SKIP	—	Not assessed — check Google Ads > Goals > Conversions > Settings for custom variable configuration
D49	Cross-device assessment	API	PASS	2/2	~4,700+ monthly primary convs — well above 500 threshold for reliable cross-device modelling
D50	Maturity score	—	84%	—	Advanced — solid foundation with identified gaps in cart data and consent

Manual checks required

The following checks require manual verification and could not be automated:

CHECK	INSTRUCTIONS
D13 — Deduplication	GTM Preview: complete a test purchase, verify order_id present in both browser and server conversion hits with identical values
D17 — Backend cross-check	Pull 30-day order count from Posthog or order platform. Compare to Google Ads primary convs (38,307 lifetime)
D25 — Consent Mode	Unpause consent tag, then run Chrome DevTools on https://gimme.care/lp/semaglutide — look for gcs= and gcd= in Google

CHECK	INSTRUCTIONS
	Ads network requests
D34 — Over-attribution	Same data as D17. Calculate: Google Ads 30d convs ÷ backend 30d orders — ratio >2.0 suggests double-counting
D46 — Cart data	After enabling <code>enableProductReporting: true</code> , verify <code>items</code> array present in <code>dataLayer</code> purchase event
D48 — Custom variables	Check Google Ads > Goals > Conversions > Settings for any custom variable configuration

Recommendations

- 1. Priority 1 — Verify browser + server deduplication (highest risk).** Both `gads__purchase` (browser) and `gads - purchase` (server) fire the same conversion label `Z80BCMPQo6wbEJGPq9BB`. Open GTM Preview mode, complete a test purchase, and check whether both a browser-side and server-side conversion hit fire. Verify whether both include the same `order_id`. If no `order_id` is present in one or both, you are double-counting. Fix: either disable the browser-side Google Ads tags and let SST handle exclusively, or ensure `order_id` is passed in the browser tags for deduplication.
- 2. Priority 2 — Unpause the consent tag and verify Consent Mode v2.** The `cookie consent - gimme care` tag is PAUSED in the browser container. Unpause it, publish, then run Chrome DevTools on the landing page to verify `gcs=` and `gcd=` parameters appear in Google Ads network requests. Also directly connected to the LP audit's intake consent banner finding (INT-01) — fix this before drawing conclusions from intake CVR numbers.
- 3. Priority 3 — Enable cart data on purchase tags.** In the server container (`abc.gimme.care`), open both `gads - purchase` and `gads - first time purchase` tags and set `enableProductReporting: true`. Also pass an `items` array from the `dataLayer`. This enables product-level ROAS reporting in Shopping.
- 4. Priority 4 — Fix counting method on secondary purchase actions (D06).** "Purchase (GTM)" and "Purchase (Posthog)" both use `ONE_PER_CLICK`. For ecommerce purchase events these should be `MANY_PER_CLICK` so repeat buyers

are counted correctly in those reporting columns. Change in Google Ads > Goals > Conversions > [action] > Settings > Count.

5. **Priority 5 — Fix click-through window documentation (D31).** business.md says 90 days; API shows 30 days. Check Google Ads > Goals > Conversions > First Time Purchase (GTM) - SST > Settings to confirm the actual setting, then update business.md to match.
6. **Priority 6 — Rename "checkout - first time" (D04).** Rename to "Checkout — First Time (GTM)" to match the naming convention used by all other actions. Minor but keeps reporting clean.
